→ US PTO

In the claims:

Clains 1-12 cancelled.

13. (Previously presented) A device for securing an add-on part (10) to a substantially smooth drive shaft (12), having a one-piece slaving element (14), which is seated in a manner fixed against relative rotation on the drive shaft (12) and transmits a rotary motion from the drive shaft (12) to the add-on part (10), and having only one spring element (16), which axially secures the add-on part (10) on the drive shaft (12), characterized in that the slaving element (14) penetrates the add-on part (10), and the spring element (16) is braced directly on the slaving element (14) and on the add-on part (10) and thus axially fixes the add-on part (10) on the drive shaft (12).

14. (Previously presented) The device of claim 13, characterized in that the add-on part (10) is clamped between the spring element (16) and a portion of the slaving element (14).

Claim 15 cancelled.

- 16. (Previously presented) The device of claim 13, characterized in that the slaving element (14) has a collar-shaped widening (18), on which the spring element (16) is braced.
- 17. (Previously presented) The device of claim 16, characterized in that the add-on part (10) has recesses (40), through which the slaving element (14) can be passed with its collar-shaped widening (18).

Claim 18 cancelled.

- 19. (Previously presented) The device of claim 13, characterized in that the slaving element (14) has a plate-shaped widening (20) of its diameter, at which the add-on part (10) is braced.
- 20. (Previously presented) The device of claim 16, characterized in that in the platelike widening (20), the slaving element (14) has recesses (4:2) corresponding to the location of the collar-shaped widening (18).
- 21. (previously presented) The device of claim 13, characterized in that the spring element (16) is a circular cup spring that is open on one side.

- 22. (original) The device of claim 13, characterized in that the spring element (16) is secured on the add-on part (10) against later twisting by means of a positioning pin.
- 23. (original) The device of claim 13, characterized in that the add-on part (10) to be secured is a vane wheel of a fan.
- 24. (original) The device of claim 13, characterized in that the slaving element (14) is press-fitted onto the drive shaft (12).
- 25. (Previously presented) A device for securing an add-on part (10) to a substantially smooth drive shaft (12), having a one-piece slaving element (14), which is seated in a manner fixed against relative rotation on the drive shaft (12) and transmits a rotary motion from the drive shaft (12) to the add-on part (10), and having a spring element (16), which axially secures the add-on part (10) on the drive shaft (12), characterized in that the slaving element (14) penetrates the add-on part (10), and the spring element (16) is braced on the slaving element (14) and on the add-on part (10) and thus axially fixes the add-on part (10) on the drive shaft (12), and also directly abuts against the slaving element (14) and against the add-on part.

26. (Previously presented) A device for securing an add-on part (10) to a substantially smooth drive shaft (12), having a one-piece slaving element (14), which is seated in a manner fixed against relative rotation on the drive shaft (12) and transmits a rotary motion from the drive shaft (12) to the add-on part (10), and having only one spring element (16), which axially secures the add-on part (10) on the drive shaft (12), characterized in that the slaving element (14) penetrates the add-on part (10), and the spring element (16) is braced directly on the slaving element (14) and on the add-on part (10) and thus axially fixes the add-on part (10) on the drive shaft (12), and that the spring element (16) is embodied in one piece.

27. (Previously presented) A device for securing an add-on part (10) to a substantially smooth drive shaft (12), having a one-piece slaving element (14), which is seated in a manner fixed against relative rotation on the drive shaft (12) and transmits a rotary motion from the drive shaft (12) to the add-on part (10), and having a spring element (16), which axially secures the add-on part (10) on the drive shaft (12), characterized in that the slaving element (14) penetrates the add-on part (10), and the spring element (16) is braced directly on the slaving element (14) and on the add-on part (10) and the satisfy fixes the add-on part (10) on the drive shaft (12), and in that the add-on part (10) has positive form-locking engagement with

the slaving element (14) such that the add-on part (10) positively interlocks with the slaving e ement (14) in direct contact with the slaving element (14) and embraces it.

28. (New) A device for securing an add-on part (10) to a substantially smooth drive shaft (12), having a one-piece slaving element (14), which is seated in a manner fixed against relative rotation on the drive shaft (12) and transmits a rotary motion from the drive shaft (12) to the addon part (10), and having only one spring element (16), which axially secures the add-on part (10) on the drive shaft (12), characterized in that the slaving element (14) penetrates the add-on part (10), and the spring element (16) is braced directly on the slaving element (14) and on the add-on part (10) and thus axially fixes the add-on part (10) on the drive shaft (12), wherein the slaving element (14) has pin means extending in an axial direction and engaging into the add-on part (10), while the add-on part (10) has pin means extending in the same axial direction and surrounding the spring element (16).
